ArcelorMittal Indiana Harbor LLC
Central Wastewater Treatment Plant Outfall 001
Oil Sheen Sampling Study Preliminary Report

1. Introduction

As part of ArcelorMittal's comprehensive third-party investigations of oil sheen issues at Indiana Harbor Central Wastewater Treatment Plant (IH CWTP) Outfall 001 and Indiana Harbor West Outfalls 009 and 010, ArcelorMittal commissioned a preliminary oil source characterization assessment of possible discharges of oil to IH CWTP Outfall 001 and the IH CWTP process wastewater treatment system (Outfall 101). IH West Outfall 002 was not included in this assessment because Outfall 002 discharges only non-contact cooling water and storm water. Oil sheens have not been observed on the Outfall 002 discharge.

The oil source characterization assessment for IH CWTP Outfalls 001 and 101 included sampling and analysis of cold rolling solution from the U. S. Steel East Chicago Tin Operations (ECTO), oil in the IH CWTP untreated and treated wastewaters, oil in the South Sewer leading to Outfall 001 from U. S. Steel ECTO and oil sheens collected from behind the steel weir at Outfall 001 to the extent they were observed. In addition, oil sheens observed in the Lake George Canal and the Indiana Harbor Ship Canal (IHSC) were sampled and analyzed. Chemical and biomarker fingerprinting techniques were used to characterize the components of the oils sampled at each location with the objective of determining the source or sources of oil sheens that have been observed at Outfall 001.

Amendola Engineering, Inc. (Lakewood, OH) collaborated with ArcelorMittal and NewFields Environmental Forensics (Rockland, MA) on the study design. Amendola Engineering collected the field samples and prepared this study report. Analytical services were provided by Alpha Analytical, Inc. (Mansfield, MA) under direction from NewFields Environmental Forensics. NewFields Environmental Forensics provided assessments of the analytical results.

As presented in Attachment B (NewFields report), the principal findings from this study are as follows:

- Both oil sheens collected from behind the steel weir at Outfall 001 comprised a comparable type/mix of mineral oil(s), i.e., dearomatized lubricating and/or hydraulic oils.
- Oil collected from the U. S. Steel south sewer was highly comparable to the oils collected from behind the steel weir at Outfall 001.
- Oils collected at the influent to the CWTP and from behind the CTWP clarifier weir were similar to each other, but distinct from the oils collected from behind the Outfall 001 steel weir.
- The U. S. Steel cold rolling solution is composed of a non-petroleum (biological or synthetic) base oil. If it contributed to the oil sheens observed behind the Outfall 001 steel weir, the contribution was too small to be recognized using the methods used for this study.

- The oil sheens collected at Indianapolis Boulevard (Lake George Canal) and W. Columbus Drive (Indiana Harbor Ship Canal) are each comprised of weathered distillate and (non-dearomatized) residual range petroleums (e.g., diesel and residual fuel oils, or perhaps crude oil) that are distinct from the sheens collected behind the Outfall 001 steel weir.

In summary, during the period of this short-term sampling program, the south sewer from U. S. Steel ECTO appeared to be the predominant, and possibly the exclusive source of oily sheens that were observed behind the steel weir at IH CWTP Outfall 001.

2. Sample Collection Activities

U. S. Steel provided a sample of unused cold rolling solution on May 23, 2017 to ArcelorMittal. All other oil samples were collected on May 15 and May 17, 2017 by Amendola Engineering at the following locations:

Samples Collected May 15, 2017

- Oil in south sewer from U.S. Steel ECTO that discharges directly to Outfall 001
- Oil in influent pit to ArcelorMittal IH CWTP (untreated wastewaters)
- Oil sheen behind the clarifier weirs at the effluent from the ArcelorMittal IH CWTP (oil collected within the CWTP near the end of the treatment system)¹
- Oil sheens behind the steel weir at the ArcelorMittal CWTP Outfall 001 (two samples)

Samples Collected May 17, 2017

- Oil sheen from the Lake George Canal at Indianapolis Boulevard²
- Oil sheen from the IHSC at West Columbus Drive

All samples were one-time grab samples using Teflon™ mesh oil samplers, with the exception of the sample of the U. S. Steel cold rolling solution. U. S. Steel provided a sealed glass sample jar of the solution to ArcelorMittal. Samples collected using Teflon™ mesh oil samplers followed the procedures set out at ASTM D4489-95 (Practice B).³

¹ Outfall 101 is the overflow from the CWTP final clarifier. At the time of sampling, no oil or sheens were observed in the overflow channel. The oil sheen sample was collected from the surface of the clarifier behind the clarifier weir.

² The sample was collected from the IHSC behind an oil boom at Buckeye Pipeline Outfall 001 (storm water outfall) near the northern bank of the IHSC. Although oil was not observed in the IHSC outside of the oil boom at the time of sampling, oil had been observed on the IHSC at this location a number of times previously.

³ ASTM 4489-95 (Reapproved 2011). Standard Practice for Sampling Waterborne Oils.

Samples were collected to characterize oil with the objective of identifying the source or sources of oil sheens observed at CWTP Outfall 001. All grab samples were shipped under chain of custody for next day arrival at the analytical laboratory. Aerial photographs of the sample locations are presented in Figure 1 and Attachment A. GPS coordinates of the sample collection locations are included in Table 1 of the NewFields report (see Attachment B).

3. Sample Collection Methods

Pre-cleaned Teflon™ mesh sampler nets were provided to Amendola Engineering by NewFields and were transported to IH CWTP for use in the sampling program. Discrete sample identification numbers and narrative sample identifiers were provided by Amendola Engineering for each sample. Sampling personnel used new disposal latex gloves for each sample collected. The Teflon™ mesh sampler nets were removed from the sample container and affixed to the dedicated sample wand at each sample location. The Teflon™ mesh sampler nets and wands were affixed to a pole sampler for sample collection. Sample times and GPS coordinates for each sample were documented by sampling personnel.

The Teflon™ mesh sampler nets were immersed in the oils present at the south sewer leading to Outfall 001 and for the untreated oil/wastewater mixture at the influent pit to the IH CWTP process wastewater treatment system. Oil sheen samples were collected from the IH CWTP final clarifier and from behind the steel weir at Outfall 001 by moving the Teflon™ mesh sampler nets ten (10) times through the oil films/sheens that were visible at the time of sampling.

A field blank, comprising a Teflon™ mesh sample net and wand, was analyzed as part of the program. The field blank sample was collected at the south bank of the Lake George sampling site at Indianapolis Boulevard (see Attachment A) using dedicated clean sampling gloves by removing the sample net and wand from the sample container momentarily and then placing the net back into the original sample container. The field blank sample container was appropriately labeled, placed into the sample cooler with all other samples and shipped to the laboratory for analysis under chain-of-custody. At each sample location, the used Teflon™ mesh samplers were returned to the sample containers provided by NewFields. The latex gloves and sample wands were discarded in plant trash. All samples were shipped under chain of custody to the analytical laboratory using chain-of-custody forms provided by NewFields.

4. Sample Analysis

Samples were analyzed under the direction of NewFields by Alpha Analytical, Inc. (Mansfield, MA) using the following methods:

- Total Petroleum Hydrocarbons (TPH) quantitation and fingerprinting (modified EPA Method 8015D)
- Polynuclear Aromatic Hydrocarbon (PAH) quantitation and fingerprinting (modified EPA Method 8270)
- Quantitative biomarker fingerprinting, as may be determined necessary (EPA Method 8270)

More complete descriptions of the analytical methods are presented in the NewFields Preliminary Assessment Report (see Attachment B).

5. Project Responsibilities and Reporting

6. Analytical Results and Study Findings

Attachment B is the NewFields Preliminary Assessment Report, which includes the analytical results, a preliminary assessment of the chemical/biomarker fingerprinting study, and conclusions based on the preliminary assessment of the analytical results. Measured concentrations and percentages of TPH and PAH, as well as biomarker-based ratios are presented in Table 2 of the report. Figures 1 to 6 presents comparisons of oils found in the various samples.

***Preliminary Study of Outfall 001 Sheens
ArcelorMittal Indiana Harbor West
East Chicago, Indiana***

Dear Mr. Amendola,

NewFields Companies, LLC is pleased to provide you with this preliminary assessment of the results of our recent chemical fingerprinting study surrounding the nature and origin of oily sheens collected at Outfall 001 of the ArcelorMittal Indiana Harbor facility in East Chicago, Indiana, which was conducted on behalf of ArcelorMittal, your client.

The objective of this study was to characterize the sheens observed at Outfall 001 in May 2017 and compare these to a few candidate sources within the Outfall 001 “drainage basin”, including the influent/effluent from the ArcelorMittal Central Wastewater Treatment Plant (CWTP) and a tributary sewer system that includes effluent from the neighboring U.S. Steel ECTO facility. Additionally, sheens collected upstream within the Indiana Harbor Ship Canal drainage system and a U.S. Steel cold rolling solution were included (Table 1).

Samples and Analyses

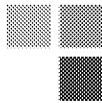

The eight sheen samples (Table 1) were collected by personnel from your firm (M. Oxsalida) on May 15 and 17, 2017 using a pre-cleaned Teflon net, as per ASTM D4489.¹ The U.S. Steel rolling solution sample was acquired by ArcelorMittal (T. Barnett) on May 23, 2017. All samples were shipped under chain-of-custody to Alpha Analytical (Mansfield, MA) for chemical analysis at the direction of NewFields. Copies of the chain-of-custody documents are attached.

All samples were analyzed using a (1) modified EPA Method 8015B and (2) modified EPA Method 8270 described in detail elsewhere² and summarized as follows:

- (1) *Total Petroleum Hydrocarbon Quantification and Fingerprinting*: a modified EPA Method 8015D employing high resolution gas chromatography-flame ionization detection (GC/FID) was used to determine the TPH concentration (C₉-C₄₄) and simultaneously provide a detailed fingerprint of the hydrocarbons present in each sample.
- (2) *PAH Quantification and Fingerprinting*: a modified EPA Method 8270D was used to determine the concentrations of 71 semi-volatile compounds or compound groups, included Priority Pollutant PAHs, alkylated PAHs, decalins, and sulfur-containing aromatics. The concentrations of total PAHs are presented in two manners as follows:

¹ ASTM (2006). Standard practices for sampling of waterborne oils. ASTM Int'l., D 4489-2006, W. Conshohocken, PA, 3 p.

² Douglas, G.D., Emsbo-Mattingly, S.D., Stout, S.A., Uhler, A.D., and McCarthy, K.J. (2015). Hydrocarbon Fingerprinting Methods. In: *Introduction to Environmental Forensics*, 3rd Ed., B. Murphy and R. Morrison, Eds., Academic Press, New York, pp. 201-309.

TPAH50 = sum of 50 analytes ranging from naphthalene to benzo-(*ghi*)perylene, exclusive of retene and benzo(*b*)fluorene, and
PPAH16 = sum of 16 Priority Pollutant PAHs.

- (3) *Quantitative Biomarker Fingerprinting*: a modified EPA Method 8270D was used to determine the concentration of 55 tri-, tetra- and penta-cyclic triterpanes, regular and rearranged steranes, and aromatic steroids. These highly diagnostic compounds can be used to distinguish different hydrocarbon sources. Numerous biomarker ratios were calculated and normalized to $17\alpha(\text{H}),21\beta(\text{H})$ -hopane (hopane).

The concentrations of all target compounds in sheens and rolling solution were reported in mg/kg_{oil}, calculated using the gravimetric weight of the extractable material in each sample.

Results

The GC/FID (TPH) chromatographs and tabulated TPH, PAH, and biomarker concentration data are attached to this report. The complete Alpha data package (Batch ID: 1705009) is being maintained by NewFields but can be made available upon request. Selected metrics for the samples studied are presented in Table 2 and selected figures are shown in Figures 1 to 6. Discussion of these results can be provided at a later date if requested.

Conclusions

The data collected show:

- (1) Both sheens collected at the Outfall 001 are comprised of a comparable type/mix of mineral oil(s), i.e., dearomatized lubricating and/or hydraulic oils.
- (2) Oil collected from the south sewer manhole also is comprised of a mineral oil(s), and based on its boiling distribution and detailed biomarker analysis, is highly comparable to the Outfall 001 sheens.
- (3) Influent and 101 clarifier oils collected from the CWTP also are each comprised of comparable type/mix of mineral oil(s), although based on their boiling distributions and detailed biomarker analysis, both are distinct from the Outfall 001 sheens.
- (4) The sheens collected at Indianapolis Blvd. and W. Columbus Dr. are each comprised of mixtures of weathered distillate and (non-dearomatized) residual range petroleums (e.g., diesel and residual fuel oils, or perhaps crude oil) that are distinct from the Outfall 001 sheens.
- (5) The U.S. Steel cold rolling solution is composed of a non-petroleum (biological or synthetic) base oil. If it contributes to the Outfall 001 sheen, its contribution is too small to recognized using the methods of this study.

Thus, based on the available data, the south sewer system appears to be the predominant-to-exclusive source of oily sheens appearing at Outfall 001 in May 2017.

If you have any questions regarding the data or results presented herein, please do not hesitate to call me at (781) 681-5040.

Sincerely,

Scott A. Stout, Ph.D., P.G.
Sr. Consulting Geochemist

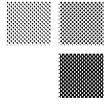

Table 1: Inventory of samples studied.

All samples consisted of Teflon nets except the U.S. Steel rolling solution, which was solid suspension in liquid.

greyed cells: relative difference > 14% versus 001 Sheen (average)

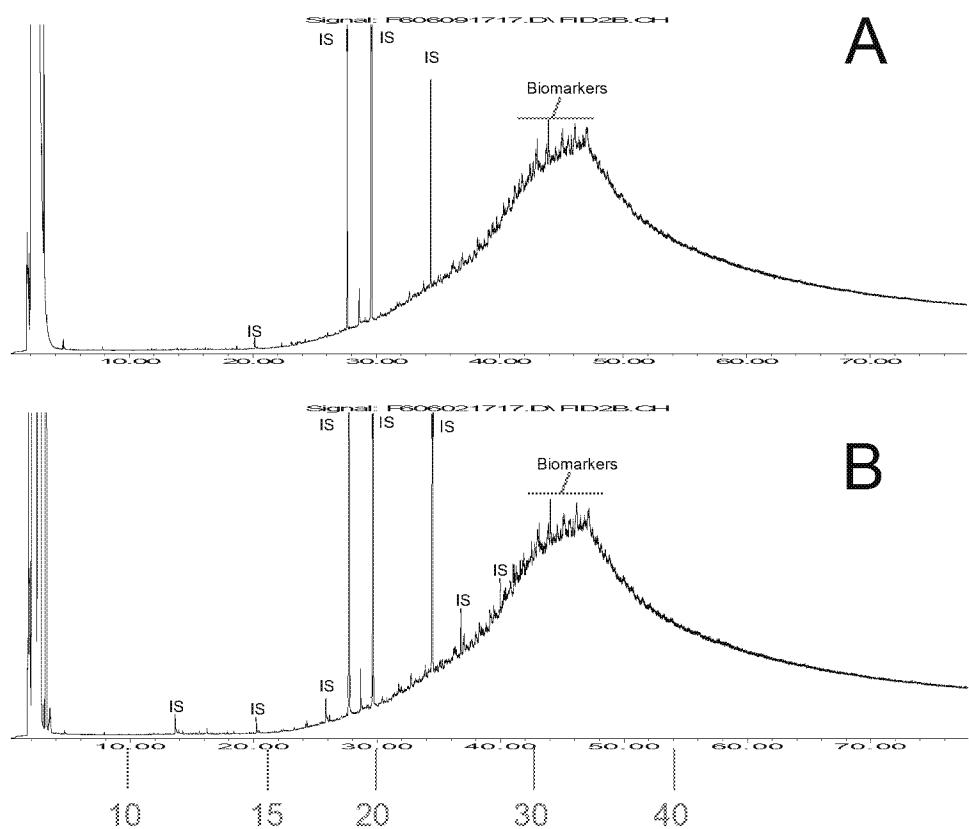

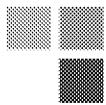

Figure 1: GC/FID chromatograms for the 001 Outfall sheens collected May 15, 2017. (A) 001 Sheen 1 and (B) 001 Sheen 2 (muck). IS: internal standards. Carbon ranges given at bottom of figure. Both sheens are comprised of similar type/mix of mineral oil(s), i.e., dearomatized lubricating and/or hydraulic oils.

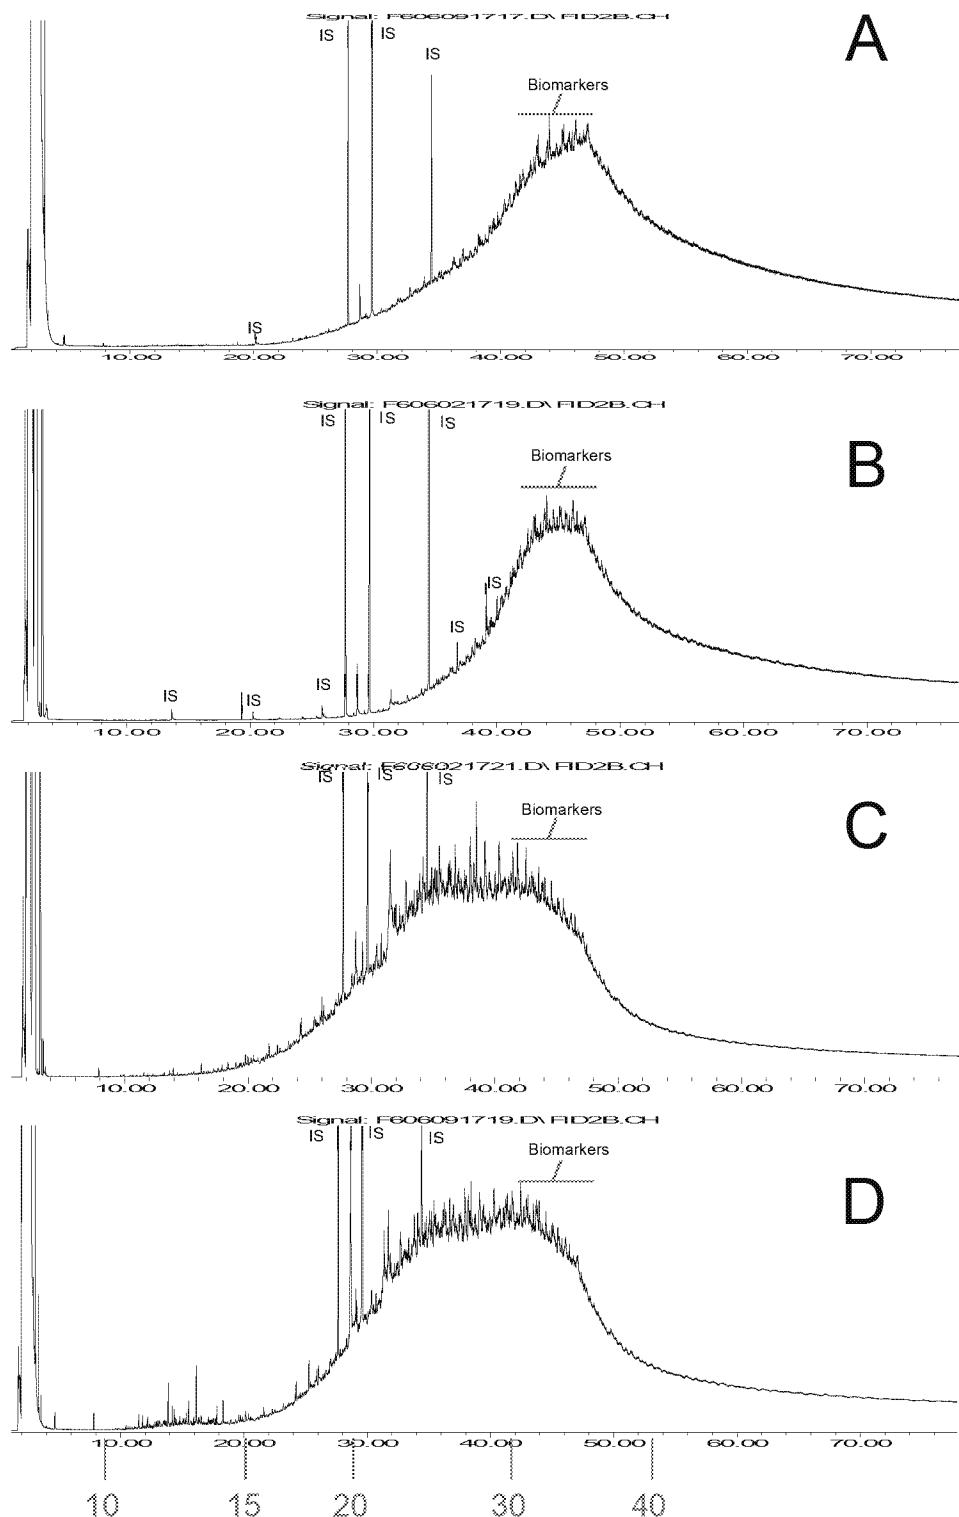

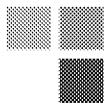

Figure 2: GC/FID chromatograms for (A) 001 Sheen 1, (B) South sewer manhole oil, (C) CWTP influent oil, and (D) 101 clarifier oil. IS: internal standards. Carbon ranges given at bottom of figure. The south sewer manhole oil and two CWTP-related oils are all comprised of mineral oil(s), although the south sewer manhole oil is most similar to the 001 sheen. The CWTP oils are highly comparable to one another but distinct from the Outfall 001 sheens.

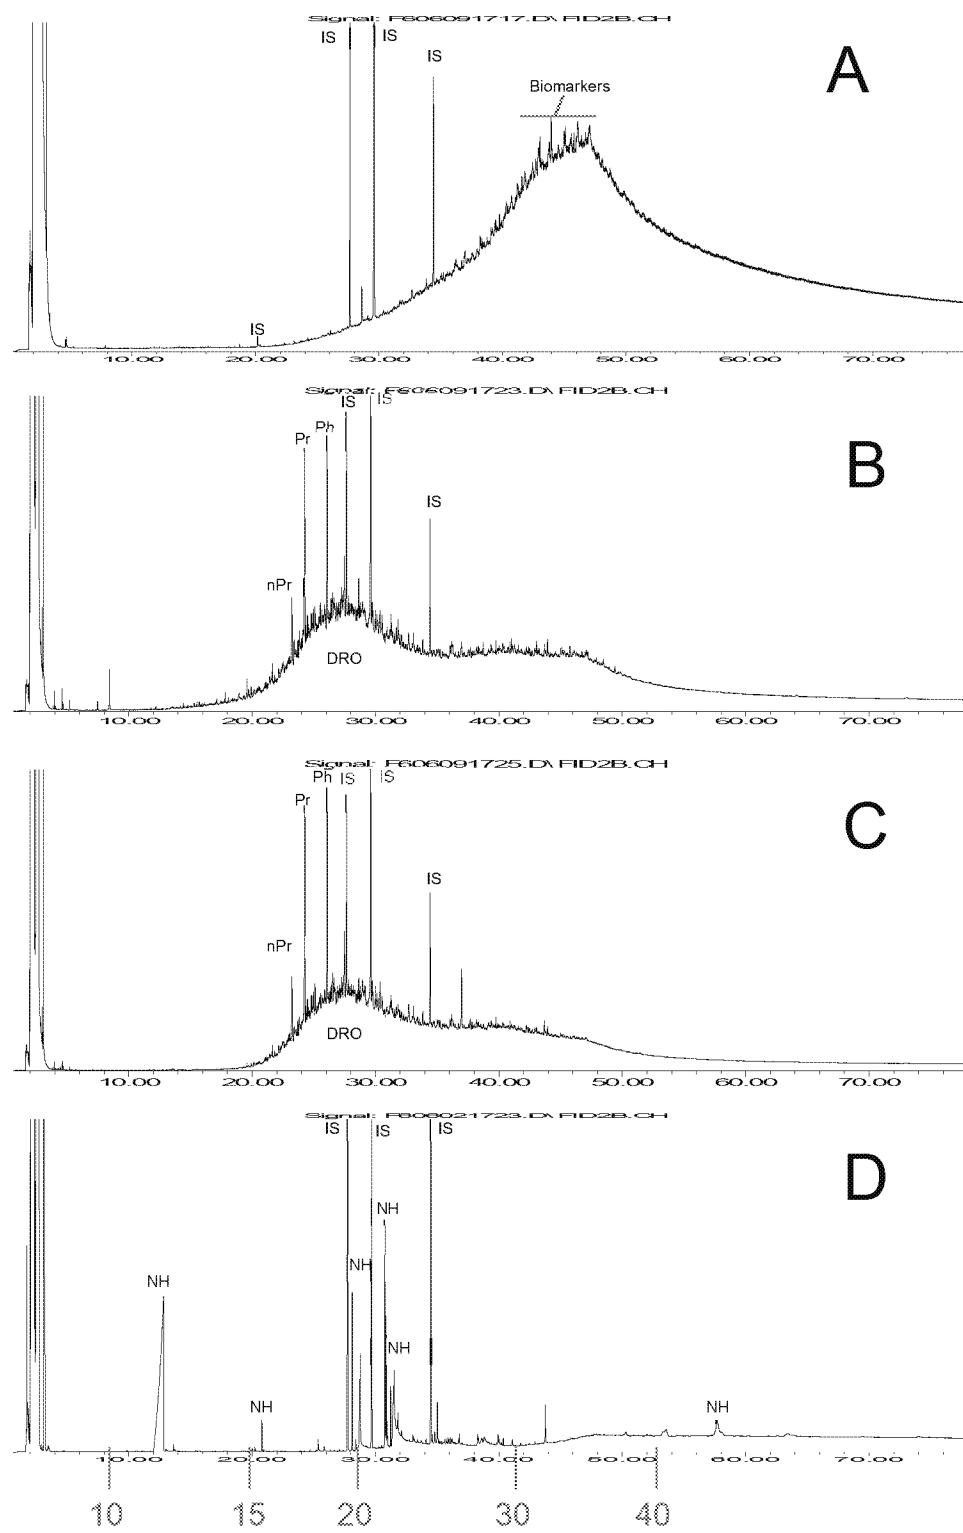

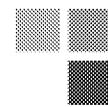

Figure 3: GC/FID chromatograms for (A) 001 Sheen 1, (B) Indianapolis Blvd. sheen, (C) W. Columbus Dr. sheen, and (D) US Steel rolling solution. IS: internal standards; Pr: pristane; Ph: phytane; nPr: norpristane; DRO: diesel range organics; NH: suspected non-hydrocarbons. Carbon ranges given at bottom of figure. The upstream sheens are each comprised of mixtures of weathered distillate and (non-dearomatized) residual range petroleums (e.g., diesel and residual fuel oil or crude oil) that are distinct from the Outfall 001 sheens. The US Steel rolling oil solution is comprised of a non-petroleum (biological or synthetic) base oil.

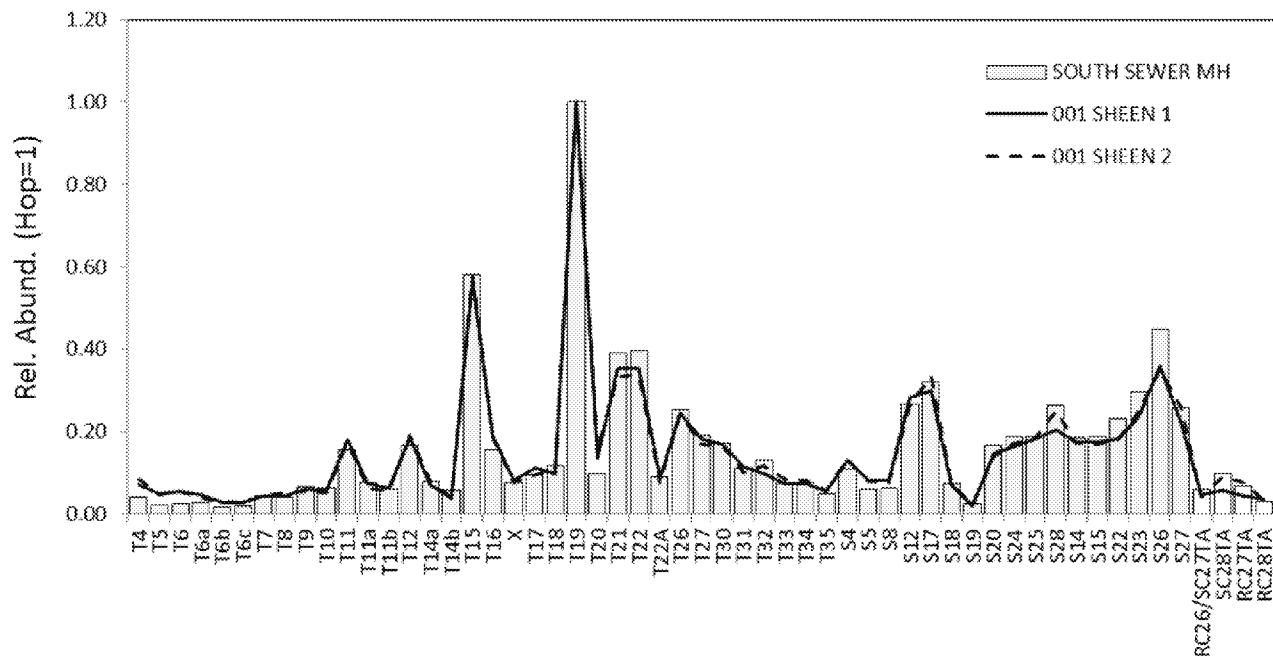

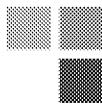

Figure 4: Histogram showing the hopane-normalized distributions of triterpanes (blue), dia- and regular steranes (red), and triaromatic steroids (yellow) in the south sewer manhole oil versus the 001 Outfall sheens. Note the high degree of comparability between the south sewer manhole oil and 001 Outfall sheens. T19=hopane, see attached tables for all other analyte abbreviations.

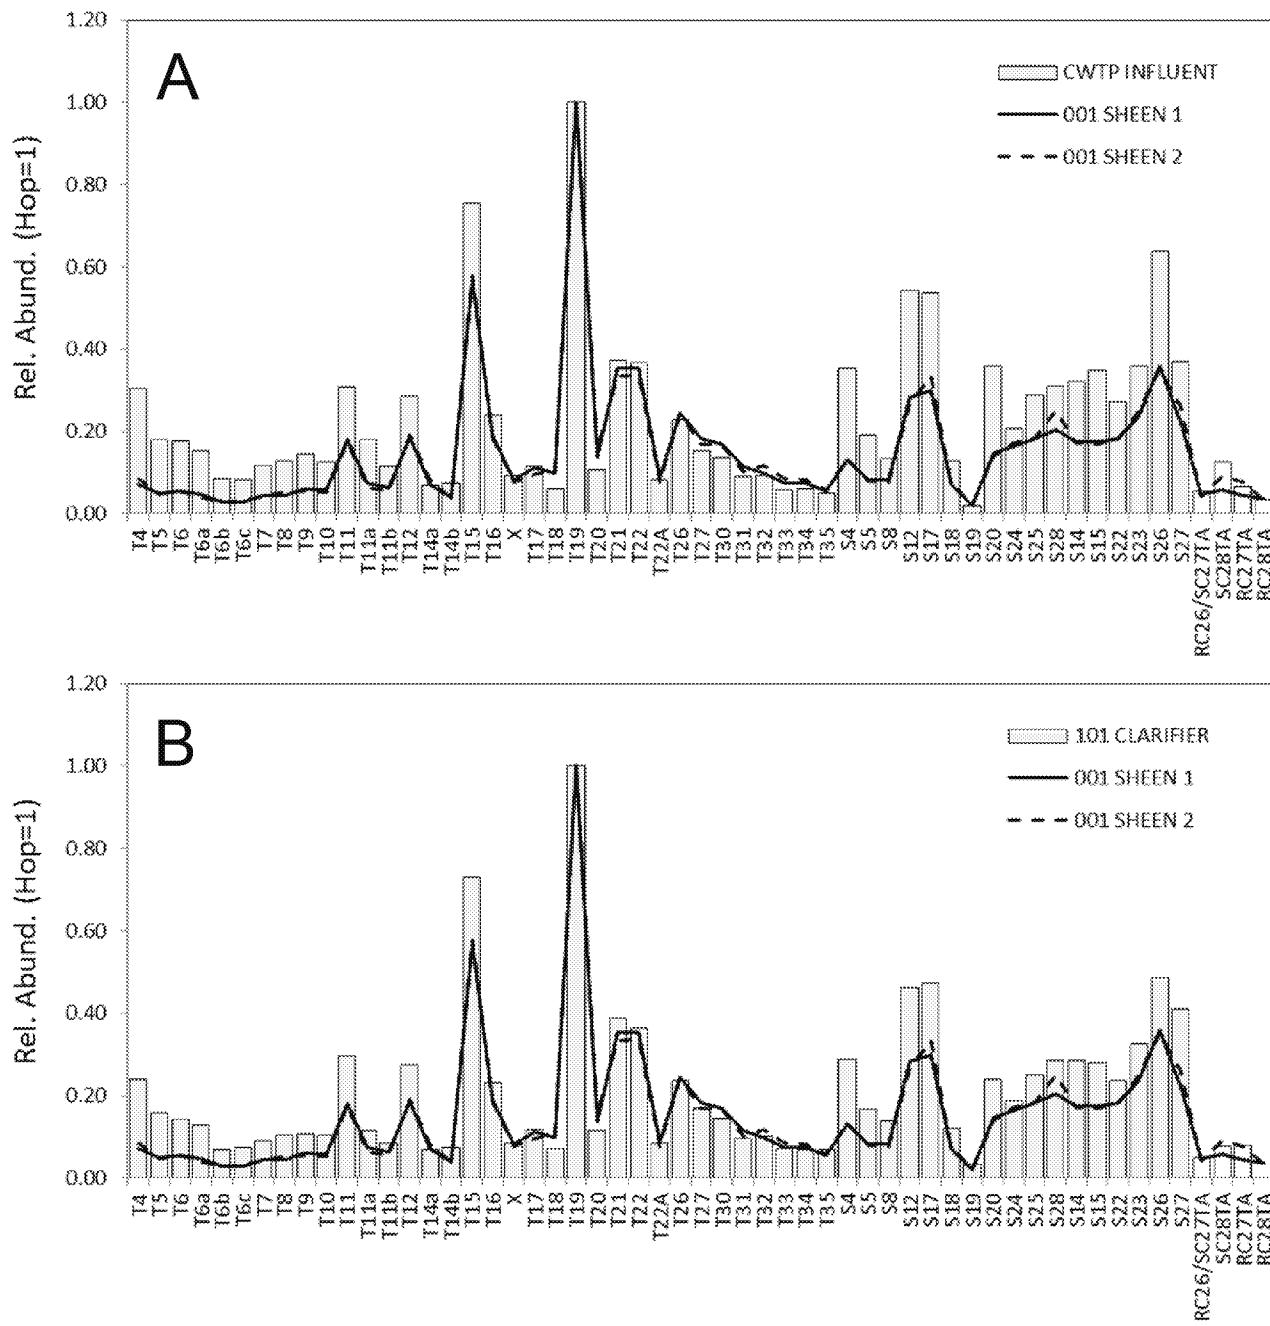

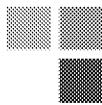

Figure 5: Histograms showing the hopane-normalized distributions of triterpanes (blue), dia- and regular steranes (red), and triaromatic steroids (yellow) in the (A) CWTP influent oil and (B) CWT 101 clarifier oil versus the 001 Outfall sheens. Note the poor comparability between the CWTP oils and 001 Outfall sheens. T19=hopane, see attached tables for all other analyte abbreviations.

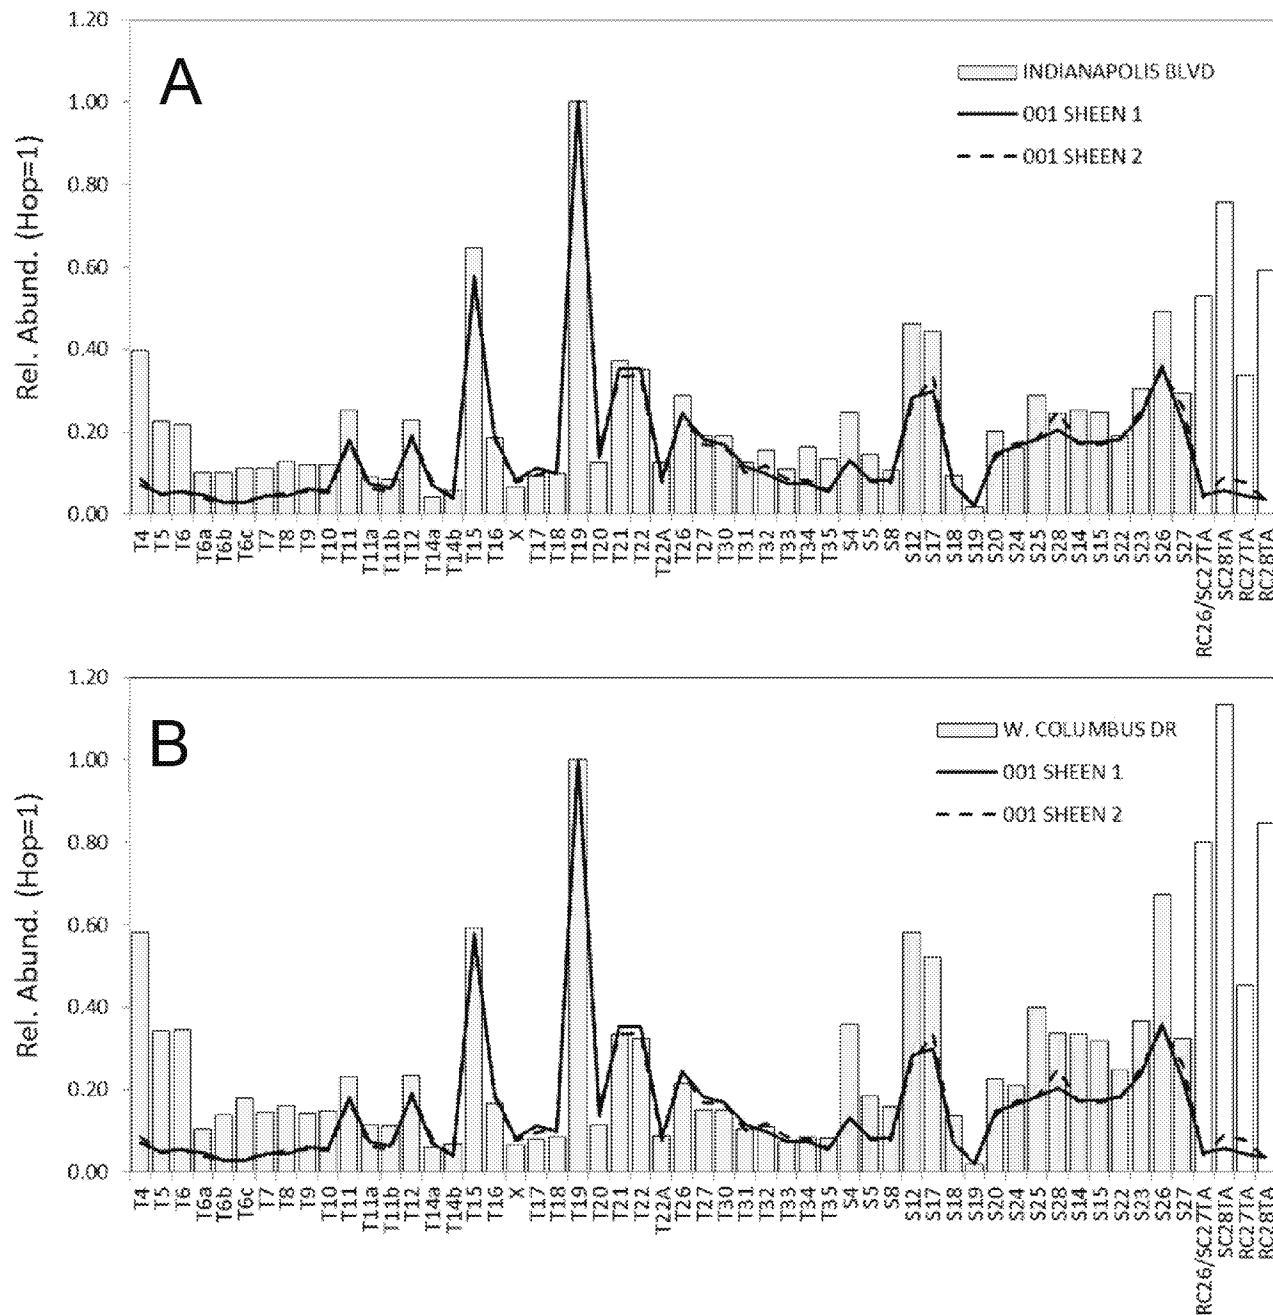

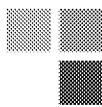

Figure 6: Histograms showing the hopane-normalized distributions of triterpanes (blue), dia- and regular steranes (red), and triaromatic steroids (yellow) in the (A) Indianapolis Blvd. sheen and (B) W. Columbus Dr. sheen versus the 001 Outfall sheens. Note the poor comparability between these upstream sheens and 001 Outfall sheens. T19=hopane, see attached tables for all other analyte abbreviations.

Surrogates (% Recovery)			
Naphthalene-d8	109	113	111
Phenanthrene-d10	103	109	105
Benz[a]pyrene-d12	100	103	100
5b(H)Cholane	129	126	119

U: The analyte was analyzed for but not detected at the sample specific level reported.
B: Found in associated blank as well as sample.
J: Estimated value, below quantitation limit.
E: Estimated value, exceeds the upper limit of calibration.
NA: Not Applicable.
D: Secondary Dilution Performed
D1: Tertiary Dilution Performed
^: Value outside of QC Limits.
S: Surrogate value outside of acceptable range.
X: It is not possible to calculate RPD, one result is below the detection limit, the other is above reporting limit.
G: Matrix Interference.
P: Greater than 40% RPD between the two columns, the higher value is reported according to the method.
I: Due to interference, the lower value is reported.
H: Spike recovery outside control limits.
E: Estimated due to Interference. (Metals)
n: Duplicate outside control limits.
P: Spike compound. (Metals)
J: Below CRDL, Project DL, or RL but greater than or equal to MDL.
C: Sample concentration is >4 times the spike level, recovery limits do not apply. (Metals)
S: Spike Compound. (Organics)
§: RPD criteria not applicable to results less than 5 times the reporting limit. (Metals)
T: Tentatively identified coexist compound.
C: Co-elution.
Z: Result not surrogate corrected.
DL: Surrogate result diluted out of sample.
W: Matrix interference may be present based on chemical reasonableness evaluation.
